How to read this page

Part 1: network concentration and route structure

The route network is broad,
but demand is sharply concentrated

Chart 1. Anchor

SYD-MEL
sits well
above
the rest

Capacity
reveals how
tightly routes
are used.

Part 2. Shock and recovery over time

This disruption changed volume faster than it changed structure.

Part 3. Airport hierarchy and concentration

Airport dominance is persistent, even when ranking move.

The largest airports
shared the shock,
not the same
rebound

Passenger scale
is concentrated
in major
airport

Airport rankings shifted
but only so far

Airport traffic
is anchored
by major
hubs

Part 4. regional dependence and travel intensity

Smaller places can matter more once the denominator changes.

Intensity
compares airports
traffic with
local population

Passengers per
resident reveal
dependence

Efficiency varies by
airport role and location

Part 5. Seasonality and behavioural patterns

Seasonality shows that recovery was also a calendar story.

Seasonality remained
part of the recovery
story.

Conclusion

Concentration

Resilience

Dependence

Rhythm
